## EDUCATION

|                                                               |                   |
|---------------------------------------------------------------|-------------------|
| <b>B.Tech in Computer Science and Engineering</b> , EIB RGIPT | Expected May 2025 |
| <b>Class XII</b> , Holy Mission School                        | 88.8%             |
| <b>Class X</b> , BRDAV Public School                          | 95.8%             |

## WORK EXPERIENCE

|                                                            |                                     |
|------------------------------------------------------------|-------------------------------------|
| <b>Software Developer Intern</b><br>Rayvector Technologies | May 2025 - Current<br><i>Intern</i> |
|------------------------------------------------------------|-------------------------------------|

- Engineered computer vision algorithms to accurately segment elliptical wafer regions from skewed camera perspectives, for subsequent stress and bow analysis critical to semiconductor manufacturing optimization.
- Contributed to semiconductor Proof-of-Concept (PoC) projects; notably investigated polarized imaging (0-135°) for enhanced wafer defect detection (e.g., subtle scratches, contamination), material identification and stress pattern analysis.

|                                                         |                                      |
|---------------------------------------------------------|--------------------------------------|
| <b>Software Developer Intern</b><br>Sambin Technologies | Nov 2024 - Jan 2025<br><i>Intern</i> |
|---------------------------------------------------------|--------------------------------------|

- Automated Customer Service and Support via Chatbots, Configured and customized pre-trained conversational model using existing datasets and customer FAQs. Integrated the chatbot into web and mobile interfaces.
- Enhanced Reporting and Business Intelligence using LLMs to convert data insights into human-readable reports via natural language generation and integrated data visualization libraries (e.g., Matplotlib)

## PERSONAL PROJECTS

|                                                                                                                                                                                           |                     |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------|
| <b>RepoMaster</b>   | Dec 2024 - Jan 2025 |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------|

- Developed automatic documentation generator (using TS, React, Python, Gemini API), reducing manual documentation time by 80% and automate the creation of essential project documentation and containerization.
- Engineered to analyze GitHub repositories and generate README, Dockerfile, and Docker Compose files.

|                                                                                                    |          |
|----------------------------------------------------------------------------------------------------|----------|
| <b>PDFSage</b>  | Sep 2024 |
|----------------------------------------------------------------------------------------------------|----------|

- Built Python Streamlit application enabling natural language queries on PDFs and TXTs.
- Leveraged Google Generative AI for vector embeddings with 90% accuracy in response generation.
- Implemented FAISS for efficient similarity search, reducing query response time by 75% .

|                                                                                                                                                                                                   |                     |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------|
| <b>Market Research AI</b>   | Jan 2025 - Feb 2025 |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------|

- Developed AI-driven market research tool using multi-agent system, automating 95% of research process.
- Integrated Gemini and Exa APIs to analyze 1000+ data points for comprehensive GenAI, LLM focused research on Companies, and Final proposal generation summarizing research, use cases, and resources.

## TECHNICAL SKILLS

**Languages:** JavaScript, TypeScript, Python, C, Go lang

**Technologies/Frameworks:** Node.js, React, Next.js, Express, Flask, FastAPI, GraphQL, PostgreSQL ,MongoDB, Tailwind CSS, LangChain, OpenCV, TensorFlow, Numpy, Pandas,Data Analytics,RAG, PyPDF2, Matplotlib

**Developer Tools:** VS Code, Cursor, GitHub, Linux, Terminal, Postman, OpenAI API, Mistral API, Gemini API, Prisma ORM, Docker, Git, GCP, AWS, Firebase, Google Sheets , Microsoft Excel
